C; Comment: Cys-1201 and Cys-2015 have free sulfhydryl groups
C; Comment: Cys-1201 and Cys-2015 have free sulfhydryl groups
C; Comment: Cys-1201 and Cys-2015 have free sulfhydryl groups
C; Comment: The plasma fibronectin molecule consists of two chains, which are connected by c; Comment: Pibronectins bind cell shape.
C; Comment: Plasma fibronectin is synthesized by hepatocytes.
C; Superfamily: fibronectin; fibronectin type I repeat homology; fibronectin type II repeat homology of Promain: fibronectin type I repeat homology of Promain: fibronectin type II repeat homology of Promain: fibronectin type III repeat homology of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Molecule type: protein

N'Alternate names: sperm-specific membrane protein
C;Species: Mus musculus (house mouse)
C;Date: 03-bec-1999 #sequence_revision 03-Dec-1999 #text_change 09-Jul-2004
C;Accession: T42215
R;Gao, Z.; Garbers, D.L.
J. Biol. Chem. 273, 3415-3421, 1998
A;Title: Species diversity in the structure of zonadhesin, a sperm-specific membrane pro
A;Reference number: Z22080; MUID:99123114; PMID:9452463
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A,Status: preliminary; translated from GB/EMBL/DDBJ
A,Status: preliminary; translated from GB/EMBL/DDBJ
A,Molecule type: mRNA
A,Molecule type: mRNA
A,Forse-references: UNIPROF:088799; EMBL:U97068; NID:g3327420; PID:g3327421; PIDN:AAC266
C,Genetics:
A,Gene: Zan
A,Map position: 5
C,Function:
A,Description: functions in multiple cell adhesion processes
A,Note: found exclusively on the apical region of the sperm head
C,Keywords: cell adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                               fibronectin, fibulin-1 and fibulin-2 in bone marrow stroma.";

Bur. J. Haematol. 67:176-184(2001).
-!- FUNCTION: Fibronectins bind cell surfaces and various compounds including collagen, fibrin, heparin, DNA, and actin. Fibronectins are involved in cell adhesion, cell motility, opsonization, wound healing, and maintenance of cell shape.
-!- SUBUNIT: Mostly heterodimers or multimers of alternatively spliced variants, connected by 2 disulfine bonds near the carboxyl ends; to a lesser extend homodimers. Interacts with FBLNI and IGALS3BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Event=Alternative splicing; Named isoforms=1;
Comment-A number of isoforms are produced. Each of the "extra
domain" and the connecting strand 3 are present in some forms of
fibronectin and absent in others;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isoid=P11276-1; Sequence=Displayed;
IISSUE SPECIFICITY: Plasma FN (soluble dimeric form) is secreted by hepatocytes. Cellular FN (dimeric or cross-linked multimeric forms), made by fibroblasts, epithelial and other cell types, is deposited as fibrils in the extracellular matrix.

INDUCTION: Glucocorticoids suppressed mRNA expression and protein
"Glucocorticoids down-regulate the extracellular matrix proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3D-structure, Acute phase, Alternative splicing, Cell adhesion, Glycoprotein, Heparin-binding, Phosphorylation, Plasma, Repeat,

                                                                                                                                                                                                                                                                                                                                                                                                                                                      Comment=A number of isoforms are produced. Each of the "extra domain" and the connecting strand 3 are present in some forms of fibronectin and absent in others;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isold=P07589-1; Sequence=Displayed;
Isold=P07589-1; Sequence=Displayed;
TISSUE SPECFICITY: Plasma FN (soluble dimeric form) is secreted by hepatocytes. Cellular FN (dimeric or cross-linked multimeric forms), made by fibroblasts, epithelial and other cell types, is deposited as fibrils in the extracellular matrix.
FTM: Sulfated (By similarity).
SIMILARITY: Contains 12 fibronectin type I domains.
SIMILARITY: Contains 12 fibronectin type II domains.
SIMILARITY: Contains 15 fibronectin type III domains.

--- ISOId=P04937-4; Sequence=VSP_003260;
--- TISSUE SPECIFICITY: Plasma FN (Soluble dimeric form) is secreted by hepatocytes. Cellular FN (dimeric or cross-linked multimeric forms), made by fibroblasts, epithelial and other cell types, is deposited as fibrils in the extracellular matrix.
--- PTM: Sulfated (By similarity).
--- SIMILARITY: Contains 12 fibronectin type II domains.
--- SIMILARITY: Contains 2 fibronectin type III domains.
--- SIMILARITY: Contains 17 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Acute phase; Alternative splicing; Cell adhesion; Glycoprotein;

                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2, A

SEQUENCE 7, Application PC/TUS9300909
GENERAL INFORMATION:
APPLICANT: LAA JOULA CANCER RESEARCH FOUNDATION
TITLE OF INVENTION: FIBRONECTIN BINDING SITES AND METHODS
TITLE OF INVENTION: EXTRACELULAR MATRIX ASSEMBLY
NUMBER OF SEQUENCES: 16
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CORRESPONDENCE ADDRESS:
ADDRESSEE: CAMPBELLAND FLORES
STARET: 4370 LA JOLLA VILLAGE DRIVE, STE 700
CITY SAN DIEGO
STARET: CALIFORNIA
COUNTRY: UNITED STATES
ZIP: 9212CATION
FILLIG DATE: 19930201
CLASSIFICATION NUMBER: PCT/US93/00909
FILLIG DATE: 19930201
CLASSIFICATION NUMBER: 34,122
REFERENCE/DOCKET NUMBER: 34,122
REFERENCE/DOCKET NUMBER: 34,122
REFERENCE/DOCKET NUMBER: FP-LA 9462
TELEPHONE: 619-535-8949
INPORMATION FOR SEO ID NO: 7: SEQUENCE CHARACTERISTICS:
LENGTH: 42 amino acids
TTELEPHONE: 42 amino acids
TTELEPHONE: 42 amino acids
TTELEPHONE: ALLO ACID
